

## *description*

---

.this web like a souq in real world  
has 2 users

customer enter system to make order  
by add to car some products and  
confirm this order after end process.  
customer can search about product ,  
rate and comment in product , to enter  
system must registration his info like  
name,password,phone,address,country  
then make verify from it's mail , then ,  
login as customer in system , customer  
can update his phone , address and  
country

in customer account can see old orders  
or current order ,  
customer can confirm current order if

he receive this order  
second user is admin  
add in database manually , then login can  
add product , remove product and  
search about customer or product and  
can remove customer (it make all  
current order for this customer  
(cancelled  
about product  
, name ,type  
number in stock ,available sizes ,  
, product id , price  
description ,photos , rate, , number sell  
it , add time  
web must learn about user search to  
recommended products in home by save  
categories he search about it to display  
first in home page
